

ABSTRACT

THE SHIFTLESS DOUBLE STROKE KEYBOARD AND WORD PROCESSOR FOR COMPUTERS will type a lower case letter when a keyboard key it is struck once and it will type a capital letter if that key is struck twice. When two lower case letters are desired as in the word better, the key is held down slightly longer to cause a repeat of that letter. The same double stroke technique is used to type the number keys. One stroke types a number and holding the key down slightly longer gives repeats of that number. The same double stroke technique is used to type the symbols on the lower and upper part of the symbol keys; the typist strikes the key once for the lower symbol and strikes that key a second time to get the upper symbol.
